

Ulurin

Helping others,
made an honest profession.

A donation platform where the fundraiser's cut is disclosed up front, capped at 0 to 10%, and enforced by a Soroban smart contract. Every rupiah's flow is provable on-chain.

DIVERTED

Rp
117.982.530.997

from a fund meant for the communities of
the **189 people killed on Lion Air JT610.**

Boeing entrusted

Rp 138,5 M

Actually spent as agreed

Rp 20,5 M

Facilities built

6 of 70

WHERE IT ACTUALLY WENT

- **Rp 33,2 miliar** into the salaries and bonuses of the charity's own staff
- **~Rp 40 miliar** into a web of companies and foundations the charity itself was affiliated with
- **Rp 10 miliar** into a cooperative
- **Rp 125 juta** paid directly to its founder

*Almost none of it was stolen the way people picture theft.
It was absorbed. The money never left the building.*

The founder was convicted of embezzlement in office.
Three years and six months. The verdicts are final. **The victims' families did not learn any of this for four years.**

AND THE HONEST ONES? THERE WAS NO DOOR FOR THEM EITHER.

Cak Budi, 2017.

Before he was a scandal, he was the kind of person this country runs on. A man from Malang who found people nobody was looking for, drove out to them, and raised the money to help. Mountain villages. Remote inland roads. He filmed the people he helped so donors could see them.

He was not paid for any of it. He could not be. So the donations landed in his own and his wife's personal bank accounts, because there was no other account for them to land in. Out of that same pool he bought a Toyota Fortuner and an iPhone 7, and said both were operational: the car to reach the villages, the phone to document the people he helped.

Perhaps that was even true.

It no longer mattered.

He apologised, sold the car for Rp 400 juta, and handed Rp 1.774.388.531 in remaining donations and sale proceeds to a charity. No charge or conviction has been reported.

THE LAW WAS STANDING THERE THE WHOLE TIME

PP No. 29 / 1980, Article 6(1)

Fundraising costs may not exceed **10%** of what is collected.

The charity ran **13,7%** for years. The ceiling existed. Nobody could see it break.

UU No. 9 / 1961

An individual may not collect public funds without a permit **at all**.

So there was no lawful structure in which he could declare a cost, take a fee, or keep a separate account.

The platforms

Kitabisa charges a **5% platform fee** and pays the campaigner **zero**.

The person who drives to the mountain and delivers the aid is, by law and by product design, unpaid.

The law is not missing.

The enforcement is.

SO THE MONEY LEAVES IN SILENCE. AND SILENCE, WHEN IT IS FINALLY SEEN, NEVER LOOKS LIKE AN OPERATING COST. IT LOOKS LIKE A FORTUNER.

Indonesia is the most generous country on earth, seven years running.

Zakat potential, per year

Rp 327,6 T

Only about **10%** is formally collected. Roughly 90% of the market never touches a traceable rail.

Total philanthropy potential, per year

Rp 650–665 T

Bappenas estimate.

Kitabisa, disbursed

Rp 830 M

8 million donors. The demand is proven. The trust is not.

TRUST COLLAPSED IN INSTITUTIONS, NOT IN GIVING

- **44,7%** of 1.500 Indonesians said they no longer trust institutions like ACT. Only **30,1%** still did. (Median, July 2022. An online poll, not a national probability survey.)
- BAZNAS watched its own qurban collection sit at roughly **47% of target** where ~80% is normal. Their deputy: trust in *institutions* fell, the will to give survived, and rerouted to **individuals**.

TRANSPARENCY IS THE BIGGEST LEVER A PLATFORM CAN PULL

- After "having more money myself", the top reason people would give more is **knowing where the money goes (36%)**, then **knowing the results (35%)**.
- **14%** of people who do not give at all say it is because they do not trust charities with their money. (CAF World Giving Report 2025, 50.000+ respondents, 101 countries.)

THE SOLUTION

The cut is disclosed, capped at 0 to 10%, and enforced by a smart contract.

The 1980 rule stops being a policy someone chooses to obey, and becomes a transaction that simply fails if it is broken.

01

The organizer's verification tier is set. That tier is what **caps their fee**: 0%, 5%, or 10%.

02

A campaign is created with a **disclosed fee**. The contract rejects anything above the tier's ceiling.

03

A donor gives. The contract **splits it on the spot**: beneficiary portion, plus the organizer's fee held in escrow.

04

The **beneficiary withdraws immediately**. They do not wait for anyone to be trusted.

05

The organizer **uploads proof** of the distribution.

06

Only then is the **organizer's fee released**.

The beneficiary does not wait for the fundraiser to be trusted.

The fundraiser waits to be trusted before they are paid.

THIS IS NOT A SLIDE DECK · DEPLOYED AND EXERCISED ON STELLAR TESTNET

CAMPAIGN CONTRACT, LIVE

CARFPJ3NBQJNRLVFYJKRZNSFWWE6HPY6F0MUVK4AU5BZWSP6LESG3EA

Every transaction below is public and checkable on **stellar.expert**, without an account, by anyone.

Run again from the product itself, not a script

The application's own server helper created a second campaign at a **5% allowance** and drove the same donate, withdraw and release path on-chain. The cap, the tier, and the proof gate all work from inside the app.

THE FULL FLOW, ON-CHAIN

- `set_tier` the organizer is placed at tier 2, capping the fee at 10%
- `create_campaign` a campaign opens with a **disclosed 10% allowance**
- `donate` **10.000.000 stroops** arrive, and the contract splits instantly
- `withdraw_beneficiary` **9.000.000** leaves for the beneficiary. No waiting.
- `upload_proof` the organizer submits proof of distribution
- `release_allowance` **1.000.000**, the fee, is finally released

*Read that order again.
It is the whole thesis.*

AND NONE OF IT FEELS LIKE CRYPTO

ONBOARDING

- **Sign in with a Google email.** A wallet is provisioned server-side. No seed phrase. Ever.
- **Top up like any Indonesian app:** debit card, credit card, virtual account transfer, QRIS, through an ordinary payment gateway.
- **Underneath:** that rupiah becomes USDC on Stellar, and USDC is what moves through the escrow, the cap, and the split.
- **On screen:** everything stays in Rupiah. The balance says Rp. The receipt says Rp.

The blockchain is not the product.

It is the plumbing that makes the promise enforceable.

Two ways to give

A short-video feed, like TikTok: a story reaches you, and you give with one tap while you still feel it. Or **a marketplace** by category, like Kitabisa or GoFundMe, for when you already know who you want to help.

WHO THIS IS FOR

Organizers, the TikTok generation of doing good

River-cleanup movements at the scale of **Pandawara** (12 juta+ followers, 1,3 juta+ kg of trash), funded event by event by sponsors that come and go. Creators who **patch broken roads on live-stream**, paid only in TikTok gifts. **Mosque kitchens** that cook only when a big donor appears. They already do the work. They just have no honest way to be paid.

Beneficiaries

A gig driver whose motorbike was stolen, or who fell ill from overwork and left a family with no income. Families of accident victims. Cancer foundations, nursing homes, orphanages, animal shelters, legal aid, independent research. Disaster response.

Donors

90% of Indonesians give. Mobile-first. They think in Rupiah. Most will never own a wallet. **They do not want crypto. They want proof.**

Doing good, as a primary job.

Today, helping people is what you do after work, if you have energy left. The best people in it burn out, and movements that touch millions still die the moment a sponsor walks away.

Not one Pandawara, but a thousand.

Not a road patched when a clip goes viral, but patched every month.

Not a kitchen that cooks when a big donor appears, but one that never stops.

When helping pays honestly, more people help. When more people help, more gets proven. When more gets proven, more people give.

Indonesia already wrote the law. It deserves a rail where that law cannot be broken.

AND HERE IS WHAT IS NOT BUILT YET

This slide is here on purpose. It is the reason you can trust every number on the ones before it.

- The **platform fee** in our business model is **not in the contract** yet.
- **Refunds and cancellation** are designed but not implemented. The contract already records every donor's contribution, which is what refunds will be built on.
- **Sumsub KYC and the video feed** are next, not done.
- A live **rupiah on/off-ramp needs a licensed anchor (VASP)**. We do not have one.
- This runs on **Testnet**. We do not claim otherwise.
